

Performance Analysis

Paper and pencil.

Don't need a working computer program or even a computer.

Some Uses Of Performance Analysis

>determine practicality of algorithm
>predict run time on large instance
>compare 2 algorithms that have different asymptotic complexity
>e.g., O(n) and O(n²)

Limitations of Analysis

Doesn't account for constant factors.

but constant factor may dominate 1000n vs n^2 and we are interested only in n < 1000

Limitations of Analysis

Modern computers have a hierarchical memory organization with different access time for memory at different levels of the hierarchy.

Limitations of Analysis

Our analysis doesn't account for this difference in memory access times.

Programs that do more work may take less time than those that do less work.

Performance Measurement

Measure actual time on an actual computer.

What do we need?

- programming language
- working program
- computer
- compiler and options to use javac -o

Performance Measurement Needs

- data to use for measurement worst-case data best-case data average-case data
- timing mechanism --- clock

Accurate Timing
long startTime = System.currentTimeMillis();
long counter;
do {
counter++;
doSomething();
} while (System.currentTimeMillis() -
startTime < 1000)
long elapsedTime = System.currentTimeMillis()
- startTime;
float timeForMethod =
((float) elapsedTime)/counter;

What Went Wrong? long startTime = System.currentTimeMillis();

UNIX time MyProgram

Bad Way To Time

do {

counter++; startTime = System.currentTimeMillis(); doSomething(); elapsedTime += System.currentTimeMillis() - startTime; } while (elapsedTime < 1000)</pre>
