

Data Representation Methods

array --- Chapter 5
linked --- Chapter 6
simulated pointer --- Chapter 7

Linear List Array Representation

use a one-dimensional array `element[]`

$$L = (a, b, c, d, e)$$

Store element i of list in `element[i]`.

Right To Left Mapping

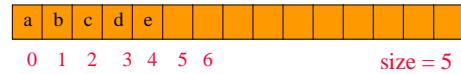

Mapping That Skips Every Other Position

Wrap Around Mapping

Representation Used In Text

put element **i** of list in **element[i]**

use a variable **size** to record current number of elements

Add/Remove An Element

size = 5

add(1,g)

size = 6

Data Type Of Array element[]

Data type of list elements is unknown.

Define **element[]** to be of data type **Object**.

Cannot put elements of primitive data types (**int**, **float**, **double**, **char**, etc.) into our linear lists.

Length of Array element[]

Don't know how many elements will be in list.

Must pick an initial length and dynamically increase as needed.

Increasing Array Length

Length of array `element[]` is 6.

First create a new and larger array

```
newArray = new Object[15];
```

Increasing Array Length

Now copy elements from old array to new one.

Increasing Array Length

Finally, rename new array.

```
element = newArray;
```

`element[0]`

```
element.length = 15
```

Altogether Now

```
// create a new array of proper length and data type  
Object [] newArray = new Object [newLength];  
  
// copy all elements from old array into new one  
System.arraycopy(element, 0, newArray, 0,  
    element.length);  
  
// rename array  
element = newArray;
```

```
public static Object [] changeLength(Object [] a,  
        int newLength)  
{  
    Object [] newArray = new Object [newLength];  
    System.arraycopy(...);  
    return newArray;  
}  
Integer [] a = new Integer [10];  
....  
a = (Integer []) changeLength(a, 100); // erroneous
```

How Big Should The New Array Be?

At least 1 more than current array length.

Cost of increasing array length is
 $\Theta(\text{new length})$

Cost of n add operations done on an initially
empty linear list increases by
 $\Theta(n^2)$

Space Complexity

element[6]

newArray = new char[7];

$$\begin{aligned}\text{space needed} &= 2 * \text{newLength} - 1 \\ &= 2 * \text{maxListSize} - 1\end{aligned}$$

Array Doubling

Double the array length.

`newArray = new char[12];`

Time for n adds goes up by $\Theta(n)$.

Space needed = $1.5 * \text{newLength}$.

Space needed $\leq 3 * \text{maxListSize} - 3$

How Big Should The New Array Be?

Resizing by any constant factor

$$\text{new length} = c * \text{old length}$$

increases the cost of n adds by $\Theta(n)$.

Resizing by an additive constant increases the cost of n add operations by $\Theta(n^2)$.

How Big Should The New Array Be?

Resizing by any constant factor

$$\text{new length} = c * \text{old length}$$

requires at most $(1+c) * (\text{maxListSize} - 1)$ space.

Resizing by an additive constant c requires
at most $(\text{maxListSize} - 1) + (\text{maxListSize} - 1 + c)$
 $= 2 * (\text{maxListSize} - 1) + c$ space.

What Does Java Do?

`java.util.Vector` ... array doubling

`java.util.ArrayList` ... $c = 1.5$

`dataStructures.ArrayList` of text ... $c = 2$
