

## Balanced Binary Search Trees

- height is  $O(\log n)$ , where  $n$  is the number of elements in the tree
- AVL (Adelson-Velsky and Landis) trees
- red-black trees
- **get**, **put**, and **remove** take  $O(\log n)$  time

## Balanced Binary Search Trees

- Indexed AVL trees
- Indexed red-black trees
- Indexed operations also take  $O(\log n)$  time

## Balanced Search Trees

- weight balanced binary search trees
- 2-3 & 2-3-4 trees
- AA trees
- B-trees
- BBST
- etc.

## AVL Tree

- binary tree
- for every node  $x$ , define its balance factor  
 $\text{balance factor of } x = \text{height of left subtree of } x - \text{height of right subtree of } x$
- balance factor of every node  $x$  is  $-1, 0$ , or  $1$

## Balance Factors

This is an AVL tree.

## Height

The height of an AVL tree that has  $n$  nodes is at most  $1.44 \log_2 (n+2)$ .

The height of every  $n$  node binary tree is at least  $\log_2 (n+1)$ .

## AVL Search Tree

## put(9)

## AVL Rotations

- RR
- LL
- RL
- LR

## Red Black Trees

### Colored Nodes Definition

- Binary search tree.
- Each node is colored **red** or black.
- Root and all external nodes are black.
- No root-to-external-node path has two consecutive red nodes.
- All root-to-external-node paths have the same number of black nodes

### Example Red Black Tree

### Red Black Trees

#### Colored Edges Definition

- Binary search tree.
- Child pointers are colored **red** or black.
- Pointer to an external node is black.
- No root to external node path has two consecutive **red** pointers.
- Every root to external node path has the same number of black pointers.

### Example Red Black Tree

### Red Black Tree

- The height of a red black tree that has **n** (internal) nodes is between  $\log_2(n+1)$  and  $2\log_2(n+1)$ .
- `java.util.TreeMap` => red black tree

## Graphs

- $G = (V, E)$
- $V$  is the vertex set.
- Vertices are also called nodes and points.
- $E$  is the edge set.
- Each edge connects two different vertices.
- Edges are also called arcs and lines.
- Directed edge has an orientation  $(u, v)$ .

$u \longrightarrow v$

## Graphs

- Undirected edge has no orientation  $(u, v)$ .
- Undirected graph  $\Rightarrow$  no oriented edge.
- Directed graph  $\Rightarrow$  every edge has an orientation.

$u \text{ --- } v$

## Undirected Graph

## Directed Graph (Digraph)

### Applications—Communication Network

- Vertex = city, edge = communication link.

### Driving Distance/Time Map

- Vertex = city, edge weight = driving distance/time.

### Street Map

- Some streets are one way.

### Complete Undirected Graph

Has all possible edges.

### Number Of Edges—Undirected Graph

- Each edge is of the form  $(u,v)$ ,  $u \neq v$ .
- Number of such pairs in an  $n$  vertex graph is  $n(n-1)$ .
- Since edge  $(u,v)$  is the same as edge  $(v,u)$ , the number of edges in a complete undirected graph is  $n(n-1)/2$ .
- Number of edges in an undirected graph is  $\leq n(n-1)/2$ .

### Number Of Edges—Directed Graph

- Each edge is of the form  $(u,v)$ ,  $u \neq v$ .
- Number of such pairs in an  $n$  vertex graph is  $n(n-1)$ .
- Since edge  $(u,v)$  is **not** the same as edge  $(v,u)$ , the number of edges in a complete directed graph is  $n(n-1)$ .
- Number of edges in a directed graph is  $\leq n(n-1)$ .

### Vertex Degree

Number of edges incident to vertex.

$\text{degree}(2) = 2$ ,  $\text{degree}(5) = 3$ ,  $\text{degree}(3) = 1$

### Sum Of Vertex Degrees

Sum of degrees =  $2e$  ( $e$  is number of edges)

### In-Degree Of A Vertex

in-degree is number of incoming edges

$\text{indegree}(2) = 1, \text{indegree}(8) = 0$

### Out-Degree Of A Vertex

out-degree is number of outbound edges

$\text{outdegree}(2) = 1, \text{outdegree}(8) = 2$

### Sum Of In- And Out-Degrees

each edge contributes **1** to the in-degree of some vertex and **1** to the out-degree of some other vertex

sum of in-degrees = sum of out-degrees = **e**,  
where **e** is the number of edges in the digraph
